

How Your Water Softener Works

Hard water contains dissolved minerals — mainly calcium and magnesium — that cause limescale on appliances, pipes, and surfaces. Your water softener removes these through ion exchange: hard water passes through a resin tank, resin beads capture the calcium and magnesium and replace them with a small amount of sodium. The result is soft water that protects your home throughout. The system regenerates automatically overnight using salt dissolved in water, called brine. You may hear a gentle sound of running water late at night — this is completely normal.

Premium Package — Dual Softener and Filter System

Premium Package customers: Your system combines a water softener and a drinking water filter in one compact unit. The drinking water tap at your kitchen sink delivers filtered water directly from this built-in filter — removing chlorine, sediment, and impurities. The filter cartridge requires replacement approximately once every 12 months. We will contact you when it is due. If you notice any change in water taste or quality from your drinking tap, call us on (1) 726 7941 straight away.

Salt — What to Use and How Often to Top Up

Standard Package

Culligan Water Softener

Use **tablet salt or block salt** specifically designed for water softeners.

Premium Package

Dual Softener and Filter System

Use **tablet salt only** as specified for this unit. Do not use block salt or any other type.

Important: Never use cooking salt, dishwasher salt, road grit, or any other type. Using the wrong salt damages your system and will void your warranty.

Household Size	Approx. Salt Usage	How Often to Check
1 to 2 people	3 to 5 kg per week	Monthly
3 to 4 people	5 to 8 kg per week	Every 2 to 3 weeks
5 or more people	8 to 12 kg per week	Weekly

What Is Normal — No Need to Worry

✓ A gentle sound of running water or a click late at night — the overnight regeneration cycle

- ✓ A small amount of water draining away during regeneration
- ✓ Water that feels slightly silkier than before — your soft water working correctly
- ✓ A very slightly salty taste at the tap immediately after regeneration — clears quickly
- ✓ The salt level in the cabinet gradually going down over time

When to Contact Us

Call (1) 726 7941 immediately	Water leaking from the unit or nearby pipes — turn off your mains stop-valve first, then call us
Limescale returning	Building back up on kettles, taps, or shower heads — system may need servicing
Unusual noises	Noises at unexpected times — not the overnight regeneration cycle
Error codes	An error light or fault code on the unit display panel
Salt not going down	Salt level unchanged over several weeks — may indicate a regeneration fault
Salt bridge	A hard crust forming over the top of the salt in the cabinet — prevents proper regeneration
Annual service	We recommend a service check every 2 to 3 years to keep your system in top condition
Premium only	Any change in taste or quality of water from your drinking water tap — call us immediately

Drinking Water

Softened water is safe for most adults to drink. However, because it contains a small amount of added sodium, it is not recommended for making up infant formula or for people on a medically prescribed low-sodium diet.

Premium Package customers: Your drinking water tap delivers clean filtered water from the built-in filter. This water contains no added sodium and is suitable for drinking, cooking, and making infant formula. Standard package customers can have a separate unsoftened tap added at any time — call (1) 726 7941 to discuss.
